# The Market Forces of Supply and Demand

Economics
N. Gregory Mankiw

Premium PowerPoint Slides by Vance Ginn & Ron Cronovich

# In this chapter, look for the answers to these questions:

- What factors affect buyers' demand for goods?
- What factors affect sellers' supply of goods?
- How do supply and demand determine the price of a good and the quantity sold?
- How do changes in the factors that affect demand or supply affect the market price and quantity of a good?
- How do markets allocate resources?

## Markets and Competition

- A market is a group of buyers and sellers of a particular product.
- A \_\_\_\_\_is one with many buyers and sellers, each has a negligible effect on price.
- In a perfectly competitive market:
  - All goods exactly the same
- In this chapter, we assume markets are perfectly

#### **Demand**

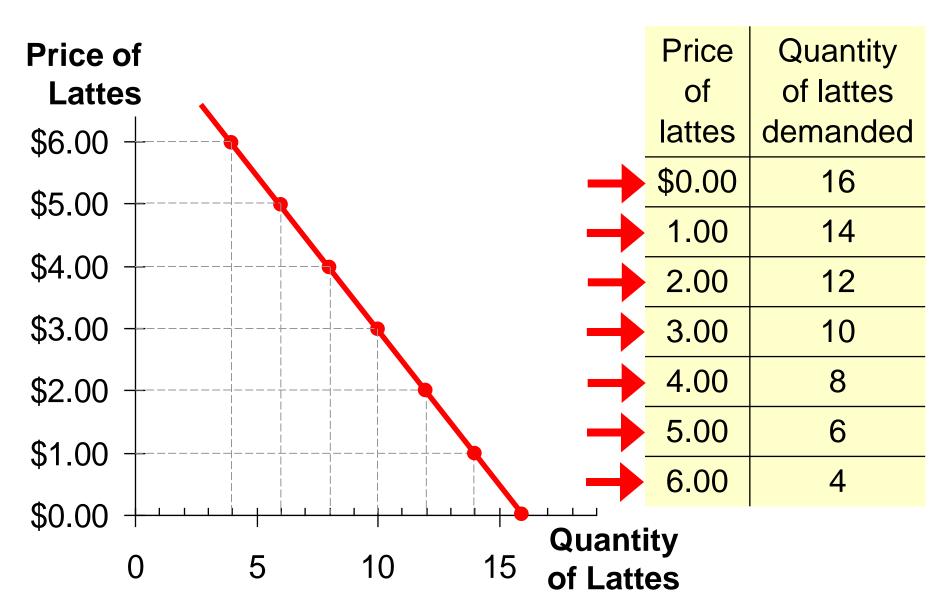

- The \_\_\_\_\_\_ of any good is the amount of the good that buyers are willing and able to purchase.
- the quantity demanded of a good falls when the price of the good rises, other things equal

#### The Demand Schedule

- Demand schedule: a table that shows the relationship between the price of a good and the quantity demanded
- Example: Helen's demand for lattes.
- Notice that Helen's preferences obey the

Price of	Quantity of lattes
lattes	demanded
\$0.00	16
1.00	14
2.00	12
3.00	10
4.00	8
5.00	6
6.00	4

#### Helen's Demand Schedule & Curve

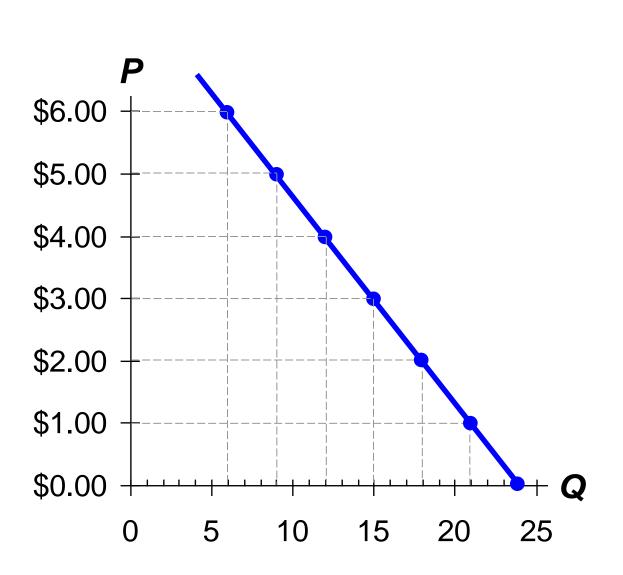

#### Market Demand versus Individual Demand

The quantity demanded in the market

• Suppose Helen and Ken are the only two buyers in the Latte market. ( $Q^d$  = quantity demanded)

Price	Helen's <b>Q</b> <sup>d</sup>		Ken's <b>Q</b> <sup>d</sup>		Market Qd
\$0.00	16	+	8	=	24
1.00	14	+	7	=	21
2.00	12	+	6	=	18
3.00	10	+	5	=	15
4.00	8	+	4	=	12
5.00	6	+	3	=	9
6.00	4	+	2	=	6

#### The Market Demand Curve for Lattes

P	<b>Q</b> d (Market)
\$0.00	24
1.00	21
2.00	18
3.00	15
4.00	12
5.00	9
6.00	6

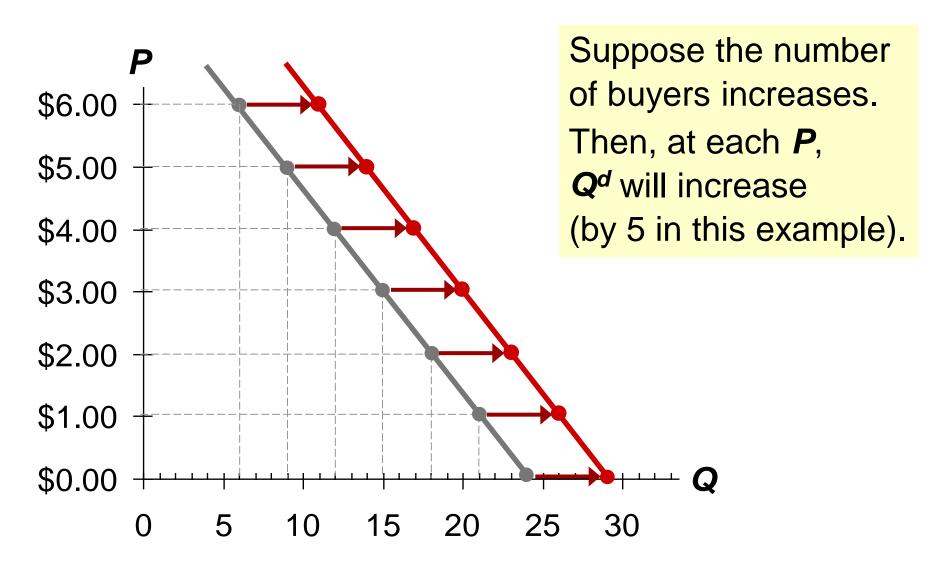

#### **Demand Curve Shifters**

- The demand curve shows how price affects quantity demanded,
- These "other things" are non-price determinants of demand (*i.e.*, things that determine buyers' demand for a good, other than the good's price).
- Changes in them shift the **D** curve...

#### **Demand Curve Shifters:** # of Buyers

Increase in # of buyers increases quantity demanded at each price, shifts D curve to the right.

#### **Demand Curve Shifters: # of Buyers**

#### **Demand Curve Shifters: Income**

- - Increase in income causes increase in quantity demanded at each price, shifts **D** curve to the right.

(Demand for an \_\_\_\_\_\_is negatively related to income. An increase in income shifts **D** curves for inferior goods to the left.)

## Demand Curve Shifters: Prices of Related Goods

- Two goods are \_\_\_\_\_ if an increase in the price of one causes an increase in demand for the other.
- Example: pizza and hamburgers. An increase in the price of pizza increases demand for hamburgers, shifting hamburger demand curve to the right.
- Other examples: Coke and Pepsi, laptops and desktop computers, CDs and music downloads

## Demand Curve Shifters: Prices of Related Goods

- Two goods are \_\_\_\_\_\_ if an increase in the price of one causes a fall in demand for the other.
- Example: computers and software. If price of computers rises, people buy fewer computers, and therefore less software. Software demand curve shifts left.
- Other examples: college tuition and textbooks, bagels and cream cheese, eggs and bacon

#### **Demand Curve Shifters: Tastes**

Anything that causes a

will increase demand for that good and shift its **D** curve to the right.

Example:

The Atkins diet became popular in the '90s, caused an increase in demand for eggs, shifted the egg demand curve to the right.

### **Demand Curve Shifters: Expectations**

- Expectations affect consumers' buying decisions.
- Examples:
  - If people expect their incomes to rise, their demand for meals at expensive restaurants may increase now.
  - If the economy sours and people worry about their future job security, demand for new autos may fall now.

#### **Summary: Variables That Influence Buyers**

Variable	A change in this variable
Price	causes a movement along the <b>D</b> curve
# of buyers	shifts the <b>D</b> curve
Income	shifts the <b>D</b> curve
Price of related goods	shifts the <b>D</b> curve
Tastes	shifts the <b>D</b> curve
Expectations	shifts the <b>D</b> curve

## ACTIVE LEARNING 1 Demand Curve

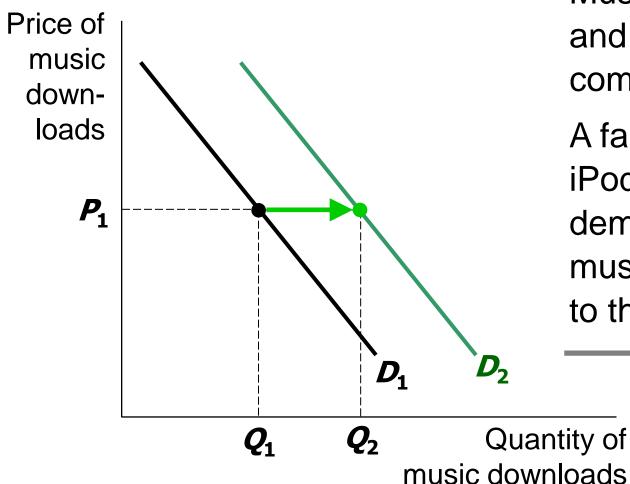

Draw a demand curve for music downloads.

What happens to it in each of the following scenarios? Why?

- A. The price of iPods falls
- B. The price of music downloads falls
- C. The price of CDs falls

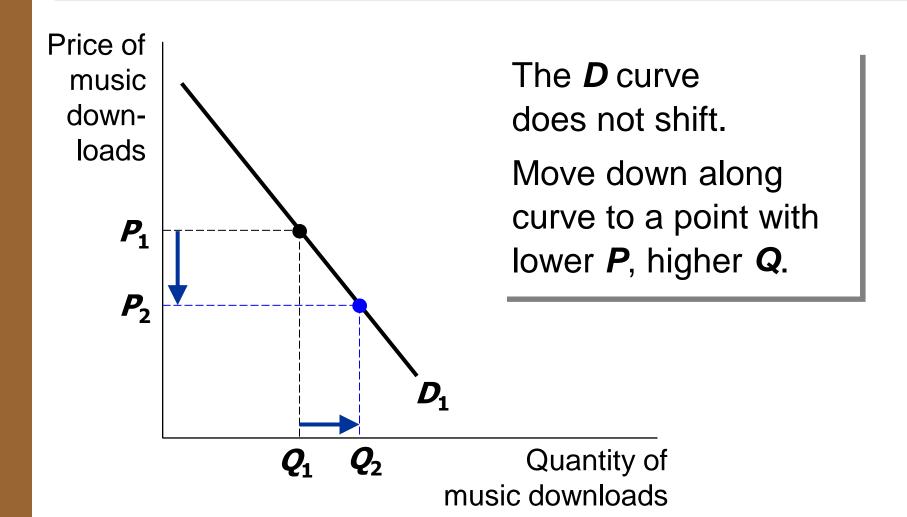

## ACTIVE LEARNING 1 A. Price of iPods falls

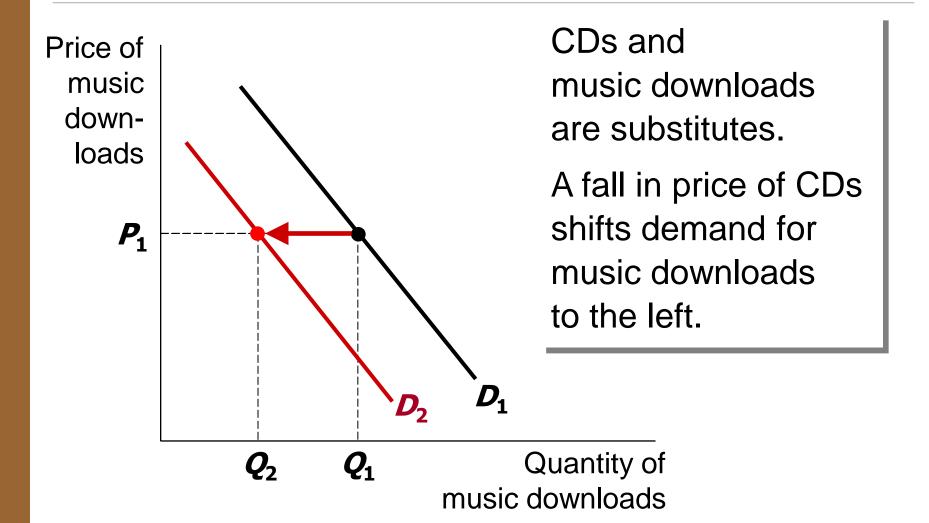

Music downloads and iPods are complements.

A fall in price of iPods shifts the demand curve for music downloads to the right.

## ACTIVE LEARNING 1 B. Price of music downloads falls

## ACTIVE LEARNING 1 C. Price of CDs falls

## Supply

- The quantity supplied of any good is the amount that sellers are willing and able to sell.
- the claim that the quantity supplied of a good rises when the price of the good rises, other things equal

### The Supply Schedule

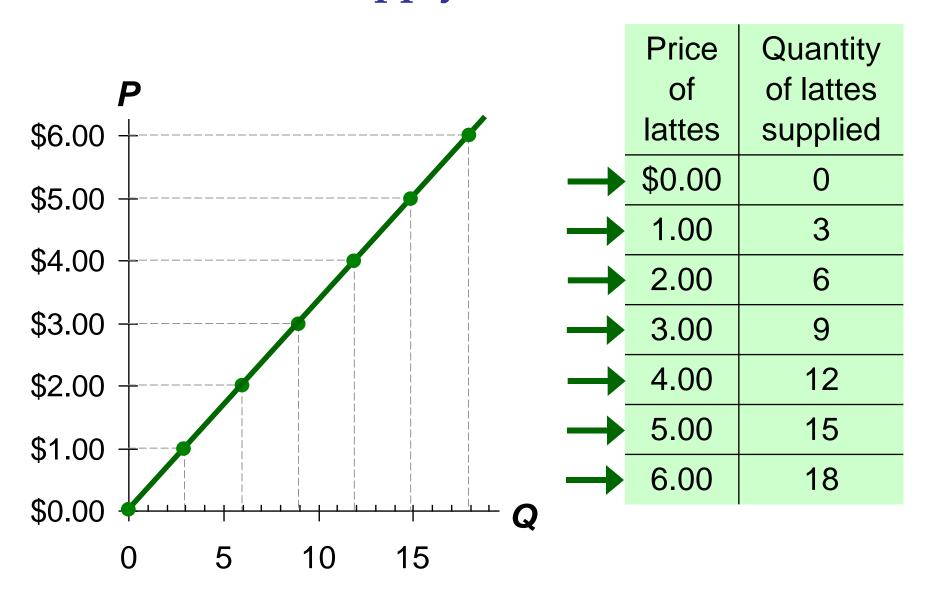

#### Supply schedule:

A table that shows the relationship between the price of a good and the quantity supplied.

- Example: Starbucks' supply of lattes.
- Notice that Starbucks' supply schedule obeys the Law of Supply.

Price of	Quantity of lattes
lattes	supplied
\$0.00	0
1.00	3
2.00	6
3.00	9
4.00	12
5.00	15
6.00	18

#### Starbucks' Supply Schedule & Curve

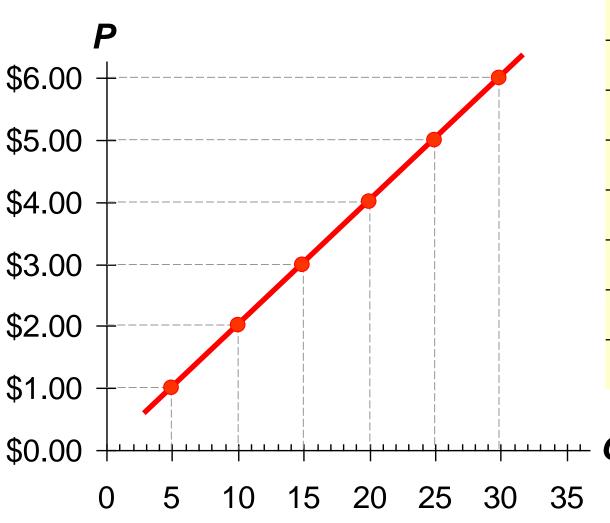

#### Market Supply versus Individual Supply

- The quantity supplied in the market is the sum of the quantities supplied by all sellers at each price.
- Suppose Starbucks and Jitters are the only two sellers in this market. ( $Q^s$  = quantity supplied)

Price	Starbucks		Jitters		Market <b>Q</b> <sup>s</sup>
\$0.00	0	+	0	=	0
1.00	3	+	2	=	5
2.00	6	+	4	=	10
3.00	9	+	6	=	15
4.00	12	+	8	=	20
5.00	15	+	10	=	25
6.00	18	+	12	=	30

### The Market Supply Curve

P	<b>Q</b> s (Market)
\$0.00	0
1.00	5
2.00	10
3.00	15
4.00	20
5.00	25
6.00	30

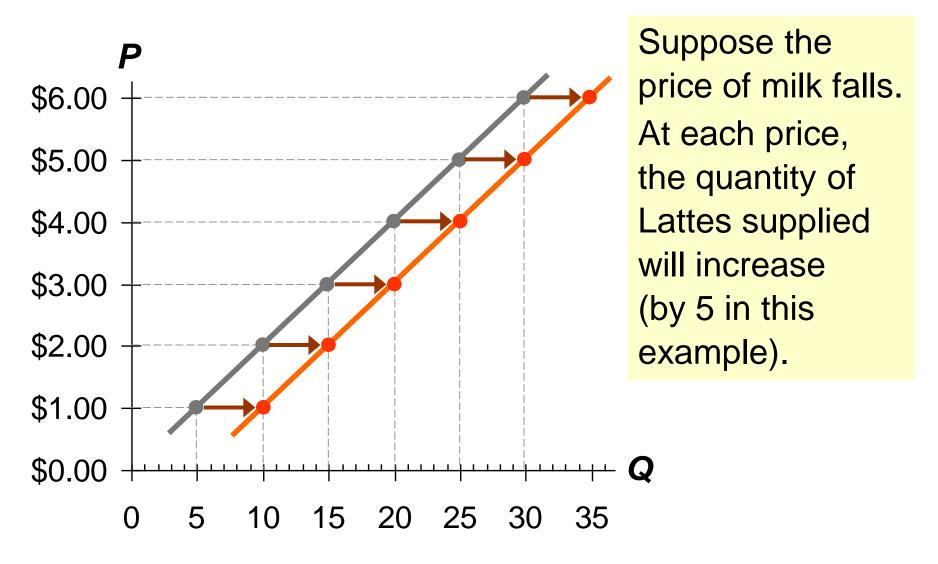

## **Supply Curve Shifters**

- The supply curve shows how price affects quantity supplied, other things being equal.
- These "other things" are non-price determinants of supply.
- Changes in them shift the S curve...

### **Supply Curve Shifters: Input Prices**

- Examples of input prices:
   wages, prices of raw materials.
- A fall in input prices makes production more profitable at each output price, so firms supply a larger quantity at each price, and the S curve shifts to the right.

### **Supply Curve Shifters: Input Prices**

## **Supply Curve Shifters: Technology**

- Technology determines how much inputs are required to produce a unit of output.
- A cost-saving technological

has

the same effect as a fall in input prices, shifts **S** curve to the right.

#### **Supply Curve Shifters:** # of Sellers

• An increase in the number of sellers increases the quantity supplied at each price, shifts S curve to the right.

## Supply Curve Shifters: Expectations

#### Example:

- Events in the Middle East lead to expectations of higher oil prices.
- In response, owners of Texas oilfields reduce supply now, save some inventory to sell later at the higher price.
- **S** curve shifts left.

In general, sellers may adjust supply when their expectations of future prices change. (\*If good not perishable)

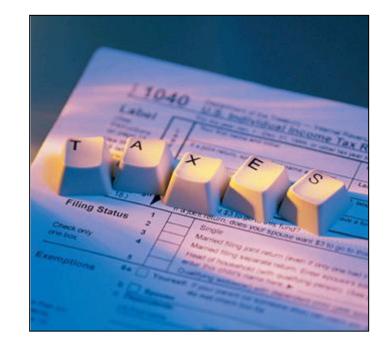

### **Summary: Variables that Influence Sellers**

Variable	A change in this variable
Price	causes a movement along the <b>S</b> curve
Input Prices	shifts the <b>S</b> curve
Technology	shifts the <b>S</b> curve
# of Sellers	shifts the <b>S</b> curve
Expectations	shifts the <b>S</b> curve

## Supply Curve

Draw a supply curve for tax return preparation software. What happens to it in each of the following scenarios?

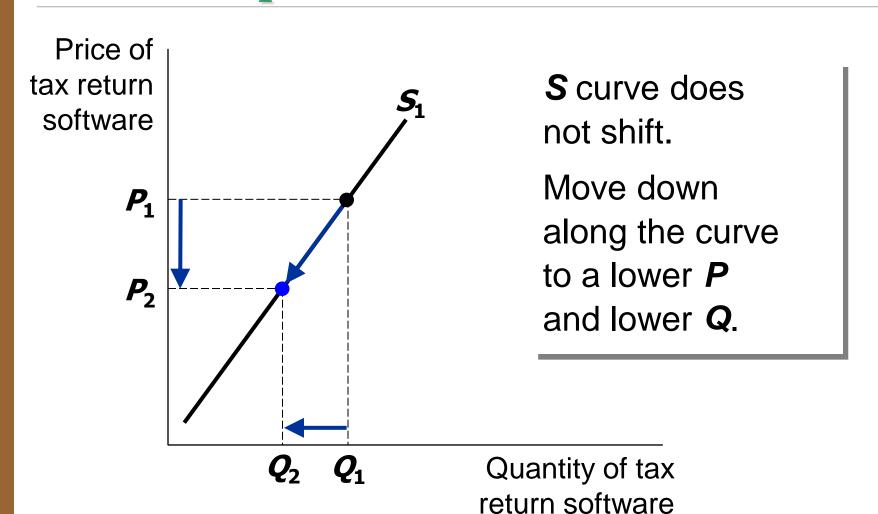

- A. Retailers cut the price of the software.
- B. A technological advance allows the software to be produced at lower cost.

C. Professional tax return preparers raise the price of the services they provide.

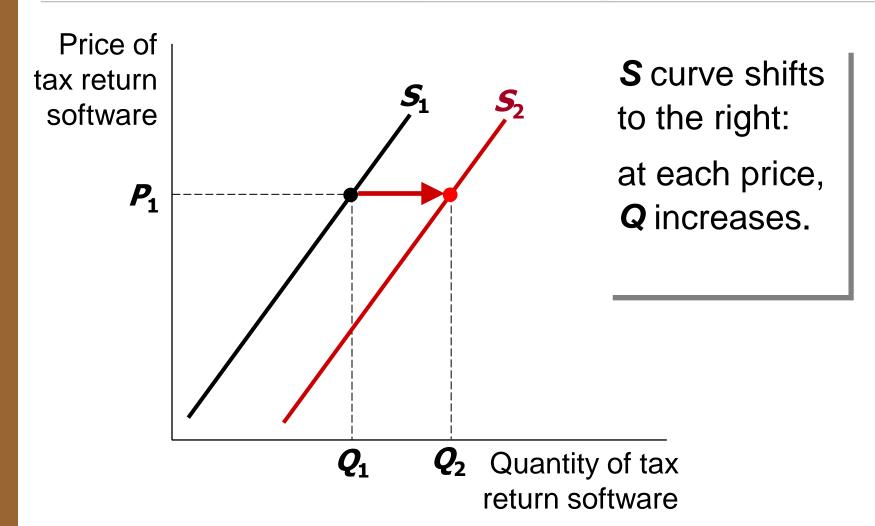

#### ACTIVE LEARNING 2

### A. Fall in price of tax return software

#### ACTIVE LEARNING 2

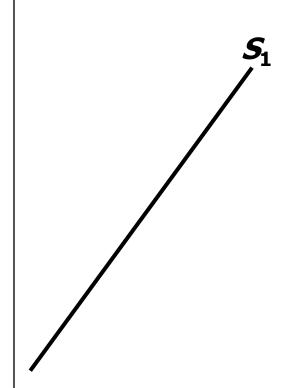

## B. Fall in cost of producing the software

#### ACTIVE LEARNING 3

#### C. Professional preparers raise their price

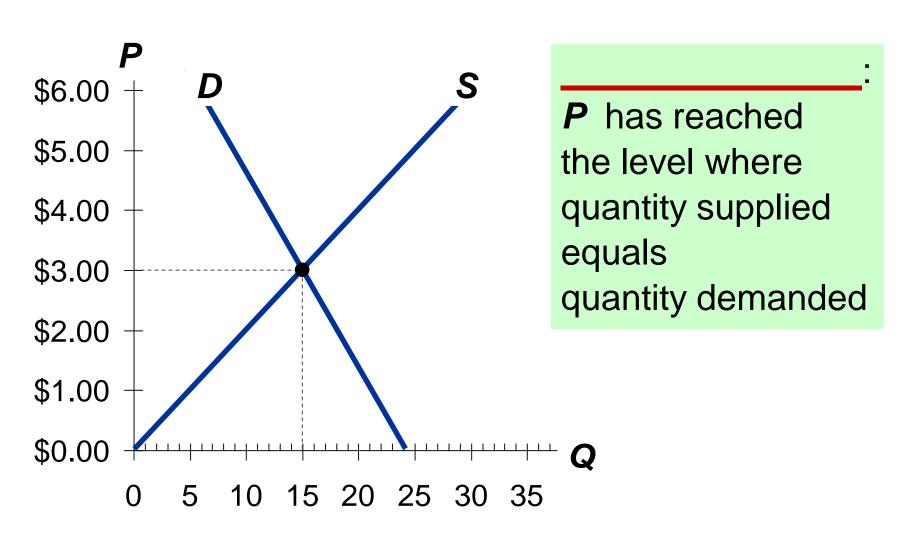

Price of tax return software

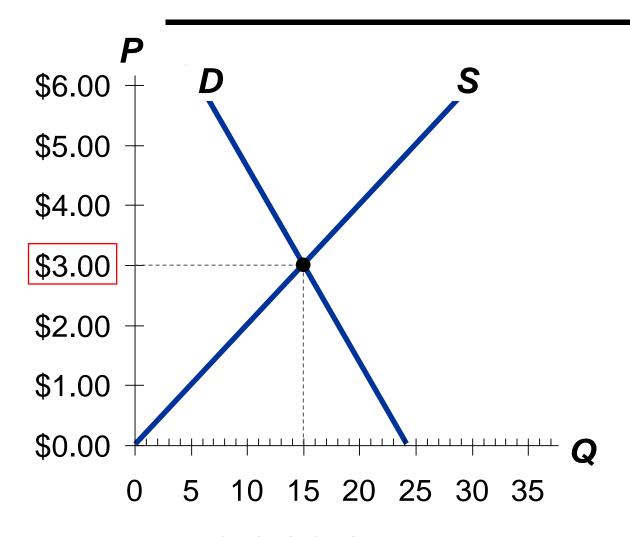

This shifts the demand curve for tax preparation software, not the supply curve.

Quantity of tax return software

#### Supply and Demand Together

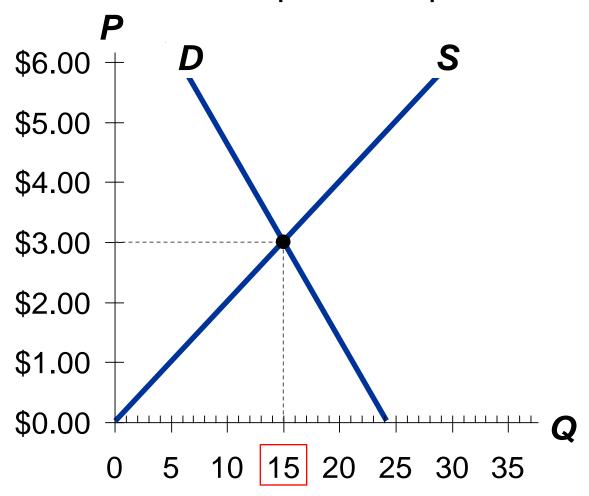

#### **Equilibrium price:**

P	$Q^D$	<b>Q</b> S
\$0	24	0
1	21	5
2	18	10
3	15	15
4	12	20
5	9	25
6	6	30

#### **Equilibrium quantity:**

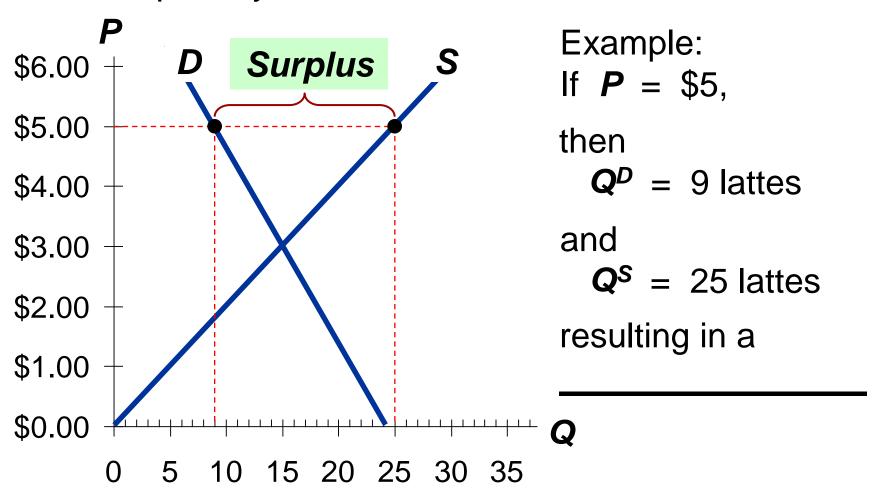

the quantity supplied and quantity demanded at the equilibrium price

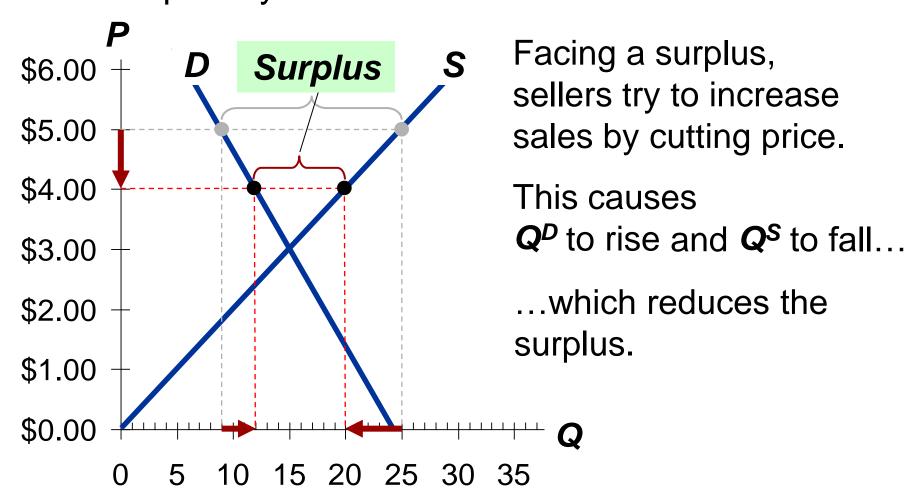

P	$Q^D$	<b>Q</b> S
\$0	24	0
1	21	5
2	18	10
3	15	15
4	12	20
5	9	25
6	6	30

#### Surplus (a.k.a.

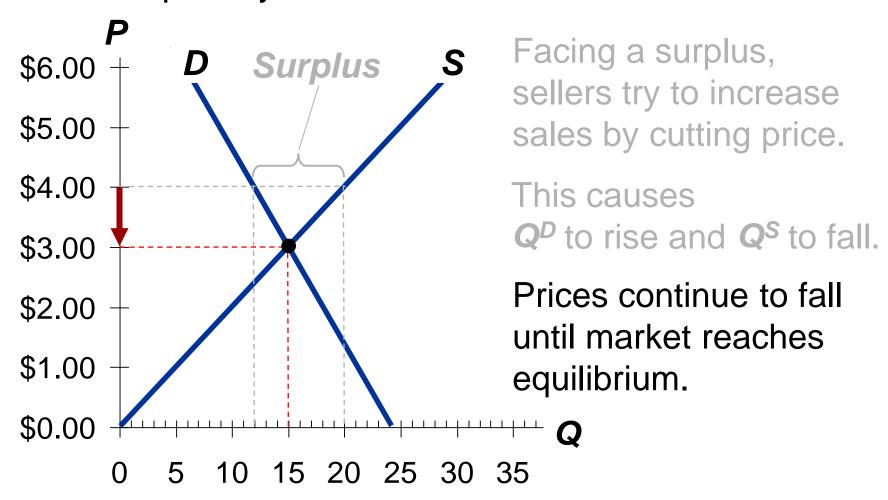

when quantity supplied is greater than quantity demanded

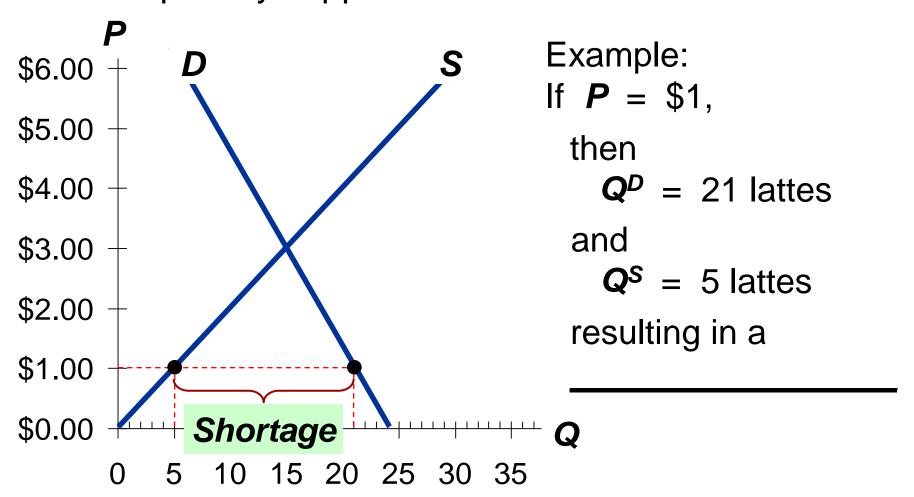

## Surplus (a.k.a. excess supply): when quantity supplied is greater than quantity demanded

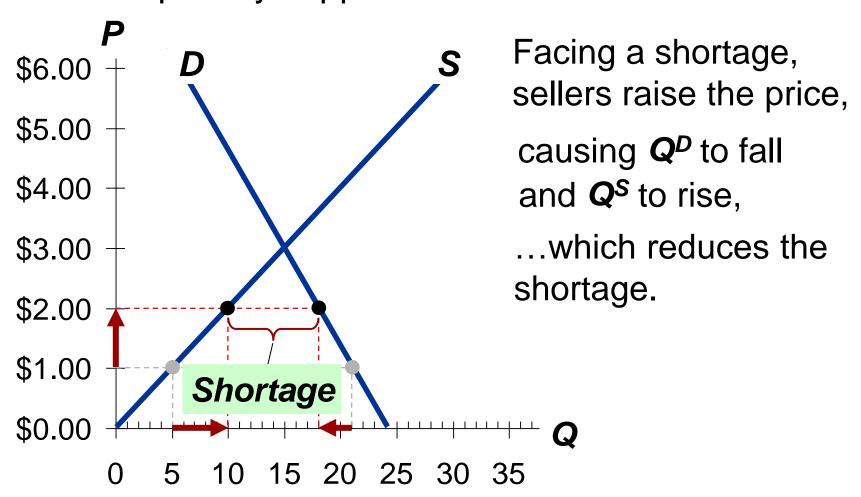

## Surplus (a.k.a. excess supply): when quantity supplied is greater than quantity demanded

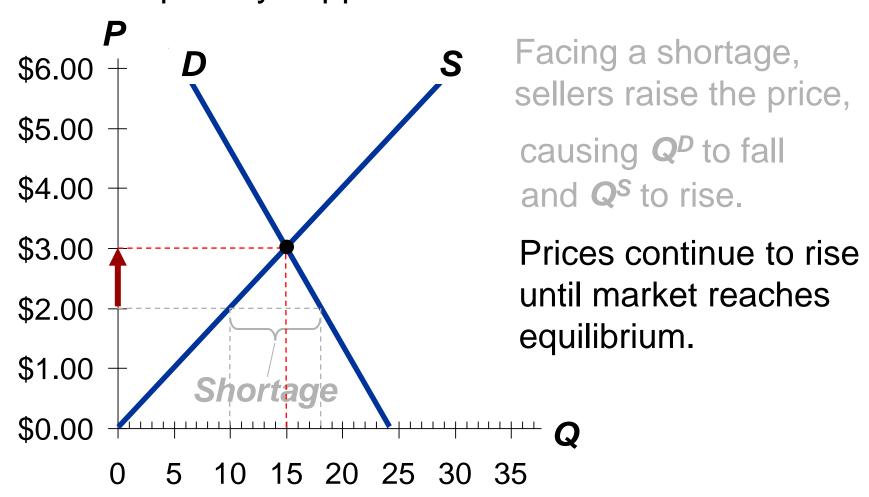

## Shortage (a.k.a. excess demand): when quantity demanded is greater than quantity supplied

## Shortage (a.k.a. excess demand): when quantity demanded is greater than quantity supplied

## Shortage (a.k.a. excess demand): when quantity demanded is greater than quantity supplied

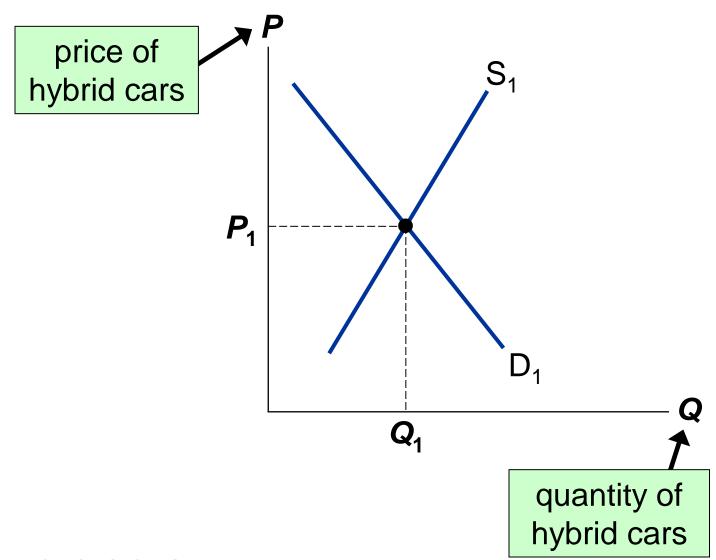

#### Three Steps to Analyzing Changes in Eq'm

To determine the effects of any event,

- Decide whether event shifts S curve,
   D curve, or both.
- 2. Decide in which direction curve shifts.
- 3. Use supply-demand diagram to see how the shift changes eq'm *P* and *Q*.

#### **EXAMPLE:** The Market for Hybrid Cars

#### **EXAMPLE 1: A Shift in Demand**

**EVENT TO BE** 

**ANALYZED:** 

Increase in price of gas.

STEP 1:

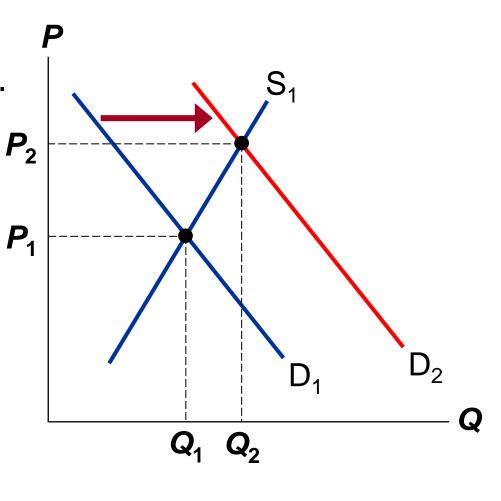

**D** curve shifts

**STEP 2:** 

D shifts right

**STEP 3:** 

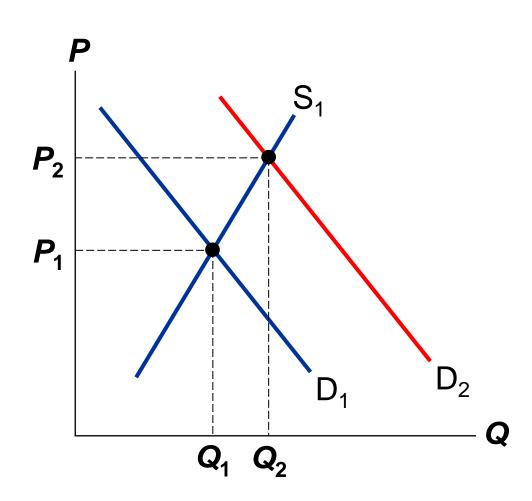

The shift causes an increase in price and quantity of hybrid cars.

#### **EXAMPLE 1: A Shift in Demand**

Notice:
When **P** rises,
producers supply
a larger quantity
of hybrids, even
though the **S** curve
has not shifted.

Always be careful to distinguish b/w a shift in a curve and a movement along the curve.

#### Terms for Shift vs. Movement Along Curve

•	Change in: a shift in the S curve occurs when a non-price determinant of supply changes (like technology or costs)
	Change in the a movement along a fixed <i>S</i> curve occurs when <i>P</i> changes
	: a shift in the <b>D</b> curve occurs when a non-price determinant of demand changes (like income or # of buyers)
	Change in the: a movement along a fixed <b>D</b> curve occurs when <b>P</b> changes

#### **EXAMPLE 2:** A Shift in Supply

**EVENT:** New technology

reduces cost of

producing hybrid cars.

#### STEP 1:

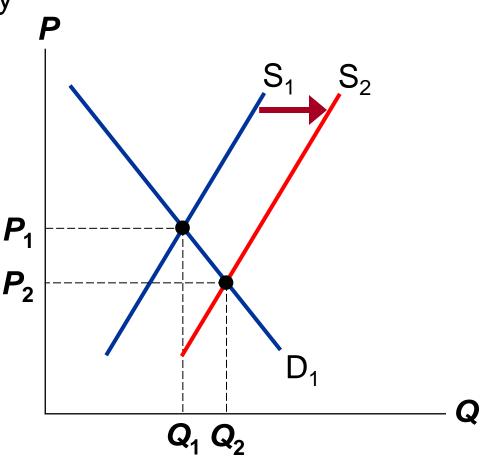

S curve shifts

#### **STEP 2:**

S shifts right

#### STEP 3:

The shift causes price to fall and quantity to rise.

### EXAMPLE 3: A Shift in Both Supply and Demand

**EVENTS:** 

price of gas rises AND new technology reduces production costs

#### STEP 1:

Both curves shift.

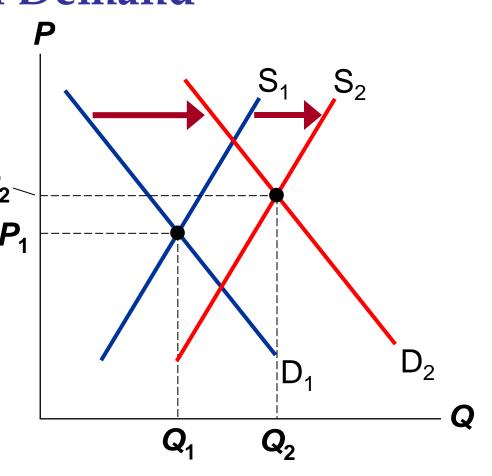

#### **STEP 2:**

Both shift to the right.

#### **STEP 3:**

**Q** rises, but effect on **P** is ambiguous:

If demand increases more than supply, **P** rises.

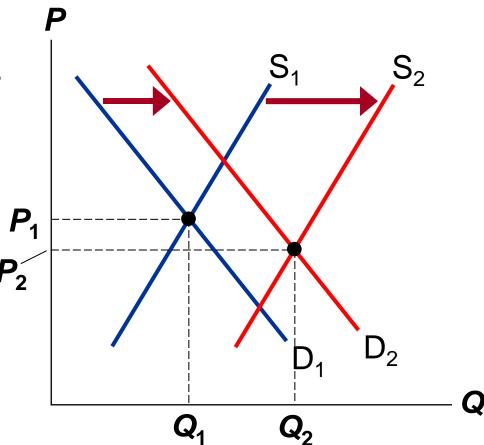

### EXAMPLE 3: A Shift in Both Supply and Demand

**EVENTS:** 

price of gas rises AND new technology reduces production costs

STEP 3, cont.

But if supply increases more than demand, *P* falls.

### CONCLUSION: How Prices Allocate Resources

- One of the Ten Principles from Chapter 1:
   Markets are usually a good way to organize economic activity.
- In market economies, prices adjust to balance supply and demand. These equilibrium prices are the signals that guide economic decisions and thereby allocate scarce resources.

- A competitive market has many buyers and sellers, each of whom has little or no influence on the market price.
- Economists use the supply and demand model to analyze competitive markets.
- The downward-sloping demand curve reflects the Law of Demand, which states that the quantity buyers demand of a good depends negatively on the good's price.

- Besides price, demand depends on buyers' incomes, tastes, expectations, the prices of substitutes and complements, and number of buyers. If one of these factors changes, the *D* curve shifts.
- The upward-sloping supply curve reflects the Law of Supply, which states that the quantity sellers supply depends positively on the good's price.
- Other determinants of supply include input prices, technology, expectations, and the # of sellers. Changes in these factors shift the S curve.

- The intersection of S and D curves determines the market equilibrium. At the equilibrium price, quantity supplied equals quantity demanded.
- If the market price is above equilibrium, a surplus results, which causes the price to fall. If the market price is below equilibrium, a shortage results, causing the price to rise.

- We can use the supply-demand diagram to analyze the effects of any event on a market: First, determine whether the event shifts one or both curves. Second, determine the direction of the shifts. Third, compare the new equilibrium to the initial one.
- In market economies, prices are the signals that guide economic decisions and allocate scarce resources.
